             extracellular portion or its active domain. The GPCR-like polypeptides and polynucleotides are useful for the treatment of diseases of ophthalmic, neurological, immunological and nephritic systems. They may also be used to treat hormonal dysfunction, cancer, atherosclerosis and diabetes. The antibodies are useful for detecting or quantitating the polypeptide in tissue. The polypeptides can also be used as molecular weight markers and as a food supplement. This sequence represents a human polynucleotide of the invention.
given in the specification, its translated or protein coding portion, its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a polynucleotide comprising a sequence given in the specification, or its mature protein.-coding portion, or its complement. The polynucleotide is useful for treating diseases e.g., cancer or neurodegenerative diseases and many others listed in the specification. The present sequence represents a novel human cDNA. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                  594 GTGACAGCTTCCTTGAGAAGCTCCATGGGCATGGCTATGGGCATGGCTAAAGG 542

```

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative clisorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, carebrovascular disorders e.g. cardiac arrest, carebrovascular disorders e.g. Alzheimer's disease and amglodensis, nervous system disorders e.g. Alzheimer's disease and amglodeficiency virus (AIDS) and fungi, ocular disorders e.g. Aqquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. diabetes e.g. corneal infection, gastrointestinal disorders e.g. dysphagia.

CC adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders involving neovascularisation e.g. malignancies, respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. cutte kidney failure and blood related disorders e.g. myocardial cinfarction. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to continuary tissues, to regenerate tissues and in chemotaxis. The primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

(HELI-) HELIX RES INST.

28-JUL-2000; 2000EP-00116126

```
The invention describes an isolated polypeptide comprising an amino acid sequence at least 90% identical to: a polypeptide fragment, domain, epitope, or full-length protein of any one of 607 amino acid sequences (I) described in the specification, a polypeptide fragment of (I), or the encoded sequence contained in (II), having biological activity; or a variant, allelic variant, or a species homologue of (I). The polypeptides and nucleic acid molecules are useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions such as neural disorders, e.g. Alzahaer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis,
medical
```

The present invention describes primer sets for synthesising 5602 full
[angth cDNAs defined in the specification. Where a primer set comprises:

[c [a] an oligo-dr primer and an oligonucleotide complementary to the

c complementary strand of a polymucleotide which comprises one of the 5602

[an oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprises a sequence complementary to the

c complementary strand of a polymucleotide which comprises a 5'-end

c complementary strand of a polymucleotide which comprises a 5'-end

c complementary strand of a polymucleotide which comprises a 5'-end

c complementary strand of a polymucleotide which complementary to the

c complementary strand of a polymucleotide which complementary to the

c complementary strand of a polymucleotide which comprises a 5'-end

c polymucleotide comprises a 1'-end sequence, where the

coligonucleotide comprises at least 15 nucleotides and the combination of

the 5'-end sequence/3'-end sequence is selected from those defined in the

coligonucleotide comprises and 1'-end sequence in selected from those defined in

c specification. The primer sets can be used in antisense therapy and in

c specification and/or diagnosis of the abnormality of the proteins encoded by

c the full-length cDNAs. The primers are also useful for the

c cDNAs easily without any specialised methods. AAH03166 to AAH13628

c represent human amino acid sequences; and AAH13629 to AAH3632 represent

c oligonucleotides, all of which are used in the exemplification of the

                                                                                                                                                                                                                                                                                                                    ö
                                                                                                          This is the nucleotide sequence bimolecular ribozyme RzA fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to anuclatic acid enzyme (e.g. delteRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the substrate (cleavage site of the binding portion of the caryme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.

                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN 5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleaved site of the substrate (cleavage site to 6 nucleotides 3' to the least one nucleotide is present 5' to the cleavage site of the substrate (cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme is used to cleave viral RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a

This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate SPL.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzPL.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GÜNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     therapeutic, biotechnological and diagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the deltaRzP1.1 sequence (AAZ57636) shown in figure 1
                                                                                                                                                                                                                                                                             cleaves substrate SP1.2 (see AA25/634). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.2) that is constructed to have a substrate binding portion with the following sequence 3. UNNXINN.5'. The substrate of the enzyme has the sequence 5'.H*6NNXINN.3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by 4'. At least one nucleotide is present 5' to the cleavage site of the substrate nucleotide sequence at a specific cleavage site of the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The nucleotide sequence as used in substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                            This is the nucleotide sequence of ribozyme deltaRzP1.2. This ribozyme

dengue virus recombinant replicon has a deletion of the complete coding sequence for prew protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of the front 20 amino acids in the C protein, and the coding region of all protein signal; coding regions of all non-structural proteins. The cohtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can cefficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a genecypressing system using of the full-length dengue virus conv. C PRS/FLD2). The recombinant virus vectors were transfected into baby has the sequence corresponds to an oligonucleotide used in the lines. This sequence corresponds to an oligonucleotide used in the
                                                                                      Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Virucide; Japanese encephalitis B virus; bivalent vaccine; hepatitis B;

The invention relates to a recombinant Japanese encephalitis B virus constructed from encephalitis B virus and a recombinant genome, where the genome is inserted with an exogenous nucleotide sequence for recombination and capable of retaining its self-replication function. The virus is useful in producing the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are producible at low cost and have high immunoefficiency, in which the recombinant virus and have high immunoefficiency, in which the vecombinant virus and immunogenicity of attenuated encephalitis B virus watchnes. The current sequence represents a PCR primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ86167-81 are primers which were used in the generation of plasmid DNA which initiates Sindbis infection. The simplified DNA sequences were used in the construction of a eukaryotic layered vector initiation system (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryotic layered vector initiation system; Sindbis; alphavirus; PCR; transcription initiation; non-structural protein; subgenomic fragment; RNA polymerase recognition sequence; ELVIS; gene therapy; amplify; primer; polymerase chain reaction; cystic fibrosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAQ86200-15 are primers which were used in the production of alphavirus vectors expressing multiple heterologous genes. These vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevent transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-WAR-2003 to correct PN field.)
junction region prevents transcription of the subgenomic fragment making vectors such as this sultable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)

Primer HDV17-68 (AAT31151) is based on hepatitis delta virus (HDV) nucleotides 833-887. It was used with reverse primer HDV49-XC (AAT30850) for the PCR amplification of HDV sequences. A second primer pair, SIN-HDV (AAT31152) and SIN276-SPE (AAT31153), is used to amplify a fragment contg. Sindbis 5'-end sequences fused to HDV sequences. Overlapping synthesis is used and second round of PCR using primers HDV49-XC and SIN276-SPE. The resulting construct contains the expression cassette elements HDV ribozyme/Sindbis 5'-end 299 nts/Sindbis junction region, designated pd5'SES. This was inserted into pcDNA3. Packaging cell line cassettes were constructed that allow inducible expression of structural proteins via alphavirus vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.

pCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and

It was used with nested primer HDV17-68 (AAT30817) and reverse primer SHDV84R (AAT30818) to generate an HDV Tibozyme. This antigenomic ribozyme can be placed between the polyA tract at the 3' end of a Sindbis virus-based eukaryotic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.

```
system, based on Sinddis. The eukaryotic layered vector initiation system comprises a eukaryotic promoter 5. of viral cDNA which initiates, in a susceptible target cell, 5 to 3' synthesis of RNA from the viral cDNA. The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an infection in vivo, especially where the immune response to an encidence, HIA class I-restricted or an HIA class is a cell mediated, HIA class I-restricted or an HIA class is a cell immune response. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating

                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                    PCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression casette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and stimulate an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryotic layered vector initiation system; stimulate; immune response; Sindbis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AAV60153-55 are used to amplify Hepatitis delta virus ribozyme sequence. The product is used in the course of the invention.

RNA comprises a vector construct which autonomously amplifies in the

```
cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I-restricted or an HLA class II-restricted immune response. PCR primers AAV70745-46 are used to amplify part of the hepatitis delta virus (HDV) genome. The amplified product is used in the production of the alphavirus vector constructs of the invention. These constructs comprise a promoter 5' of viral cDNA which initiates the synthesis of RNA from the viral cDNA by in vitro transcription, followed by a 5' sequence which initiates transcription of alphavirus RNA, followed by a nucleotide sequence encoding alphavirus nonstructural proteins, a viral junction region which has been inactivated such that viral transcription of a subgenomic fragment is prevented, an internal ribosome entry site or a sequence which promotes ribosome read through between adjacent reading frames, and an alphavirus RNA polymerase recognition sequence. The recombinant alphavirus vectors can be used for gene therapy. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alphavirus vectors constructs containing a 5' promoter of viral cDNA by in vitro transcription - used in gene therapy.

/Pharmacia with a modified polylinker; Sitel: Not I;
Site EC RI; Equal amounts of plasmid DNA_from three
normalized libraries (melanocyte 2NbHM, pregnant uterus
NDHPU, and fettal heart NDHH19W) were mixed, and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 260232-265223,
340488-345479, and 484488-489479."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  // Aref="taxon:9606"

/ CGAP_GBD] were mixed, and se dircles were made in virro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 1.M.A.G.B. clones 297480-302087, 682532-687239, 726408-728711, and 729096-731399. /clone lib="lil23 - RescueMu Grid L"
/note="Organ: leaf; Vector: RescueMu (engineered from palueScript backbone); Site 1: BamHi; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site, www.radh.iastate.edu' and follow the links for KescueMu. Grid L was grown in Moloka in 2001. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B ampicillin."

This is the nucleotide sequence bimolecular ribozyme RzA fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to an ucleic acid enzyme (e.g. delteRzPl.1) that is constructed to have a substrate binding portion with the following sequence 3.-UNNXNN-5. The substrate of the enzyme has the sequence 5'-H'*GNNINN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site of sequence by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= d

Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.
                                                                                                                                                        This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site of the substrate (cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate.
                                                                                                                                                                                                                                                                                           nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a

This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. the invention relates to a nucleic acid enzyme (e.g. the following sequence 3'-UNNXNN-5'. The substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNRNN-3'. The binding portion of the enzyme (ribozyme) hase pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage viral RNA or RNA causing for example an inherited disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; virucide; dengue virus; recombinant replicon; deletion; d protein; C protein; NS1 protein signal; vaccine; cervical cancer; al disease; antigen; dendritic cell; immune response;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                cleaves substrate SP1.2 (see AAZ37634). The uncation relates to a nucleic acid enzyme (e.g. deltaAZ91.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*CNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the deltaRzPl.1 sequence (AAZ57636) shown in figure 1
                                                                                                                                                                                                                                  deltaRzP1.2. This ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1. .6

equence for prew protein of denges wires and also includes elements of e.g. the non-coding region in the whole of the 5'-and, the coding region of the front 20 amino acids in the Cprotein, and the coding region of the front 20 amino acids in the Cprotein, and the coding region of NSI protein signal; coding regions of all non-structural proteins. The catained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthaning the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus coNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby changes trained (BHK-21 Tet-off cell lines. This sequence corresponds to an oligonucleotide used in the cerombinant replicon of the invention.
                                                   Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.
                                                                                                                                                                       A dengue virus recombinant replicon has a deletion of the complete coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B produced by recombinant technique using encephalitis B virus as vector to express antigen gene of hepatitis B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Virucide, Japanese encephalitis B virus; bivalent vaccine, hepatitis B;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAQ86167-81 are primers which were used in the generation of plasmid DNA which initiates Sindbis infection. The maplified DNA sequences were used in the construction of a cukaryotic layered vector initiation system (ELVIS) derived from Sindbis. ELVIS's comprise a 5 sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral
                                                 The invention relates to a recombinant Japanese encephalitis B virus constructed from encephalitis B virus and a recombinant genome, where the genome is inserted with an exogenous nucleotide sequence for
                                                                                                                                                                producible at low cost and have high immunoefficiency, in which the recombinant virus can efficiently express the antigen of hepatitis B virus with the safety and immunogenicity of attenuated encephalitis B virus vaccines. The current sequence represents a PCR primer used in an
                                                                                                       recombination and capable of retaining its self-replication function. virus is useful in producing the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are

These vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS's comprise a 5's sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the variety of the viral such such set this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)
junction region prevents transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)

primer HDV17-68 (AAT31151) is based on hepatitis delta virus (HDV) nucleotides 839-887. It was used with reverse primer HDV49-XC (AAT30850) for the PCR amplification of HDV sequences. A second primer pair, SIN-HDV (AAT31152) and SIN276-SPE (AAT31153), is used to amplify a fragment contg. Sindbis 5'-end sequences fused to HDV sequences. Overlapping synthesis is used in a second round of PCR using primers HDV49-XC and SIN276-SPE. The resulting construct contains the expression cassette elements HDV tibozyme/Sindbis 5'-end 299 nts/Sindbis junction region/Sindbis structural protein genes/Sindbis 3'-end untranslated region, designated pd5'-26s. This was inserted into pcDNA3. Packaging cell line cassettes were constructed that allow inducible expression of structural proteins via alphavirus vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Driver DA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
